Requirements Pack

BRD, User Stories, Acceptance Criteria & Scope

ServiceFlow

Customer Service Improvement & Project Delivery Plan

Prepared for: NovaCare Services

Prepared by: Maleesha Nanayakkara, Business Analyst & Project Manager (Intern)
Codezela Career Accelerator — Business Analysis & Project Management Internship

1. Purpose

This Business Requirements Document defines what ServiceFlow must do. It covers the scope boundaries, functional and non-functional requirements, business rules, user stories with acceptance criteria, prioritization, and requirements traceability back to the business need.

2. In Scope

#	Area	Description
01	Customer requests	Create, view, update, and close service requests.
02	Scheduling	Assign staff, date, time, and priority to each request.
03	Status tracking	New, Checked, Scheduled, In Progress, Completed and Cancelled statuses.
04	Customer records	Basic customer name, phone, location and contact history.
05	Reporting	Open requests, overdue work, completed work and staff workload views.
06	User access	Simple roles for Manager, Admin and Service Staff.

3. Out of Scope

Item	Reason
Full software build	This is a BA and PM delivery pack, not a development internship.
Payment gateway	Payment processing is not required for the core solution.
Native mobile app	A simple responsive web or internal system concept is enough.

Item	Reason
Advanced automation (AI chatbots, GPS tracking, SMS gateways)	Optional only; adds cost and complexity beyond the current need.

4. Functional Requirements

ID	Requirement	Priority
FR-01	The system must allow admin staff to create a new service request with customer name, phone, address, and issue description.	Must
FR-02	The system must allow admin staff to assign a request to a service staff member, date, time, and priority, and must not allow a request to be set to Scheduled until a staff member is assigned.	Must
FR-03	The system must allow a manager to filter requests by status and assigned staff.	Must
FR-04	The system must track each request through statuses: New, Checked, Scheduled, In Progress, Completed, Cancelled.	Must
FR-05	The system must prevent a request from being marked Completed without completion notes.	Must
FR-06	The system must allow service staff to view only the requests assigned to them.	Must
FR-07	The system must record a timestamped contact-notes history for each request.	Should
FR-08	The system must show a manager dashboard with counts of open, overdue and completed requests.	Should
FR-09	The system should allow simple export of the daily job list (e.g. to PDF/CSV).	Should

ID	Requirement	Priority
FR-10	The system could send an automatic notification when a request status changes.	Could
FR-11	The system will not include a customer-facing payment feature in this phase.	Will not

5. Non-Functional Requirements

ID	Requirement	Priority
NFR-01	The request list should load within 3 seconds for normal daily use (up to ~200 open requests).	Must
NFR-02	The system must be usable on a standard desktop browser and a mobile browser for field staff.	Must
NFR-03	Role-based access must ensure service staff cannot edit requests that are not assigned to them.	Must
NFR-04	The system should be intuitive enough that admin staff need less than 30 minutes of training.	Should
NFR-05	Basic customer data must be stored securely and only accessible to authorized roles.	Must

6. Business Rules

- A request cannot be marked Completed without completion notes.
- A request must have an assigned staff member before it can move to Scheduled status.
- Only a manager or Admin can cancel a request; Service Staff cannot cancel requests.
- Every request must retain a full status history for audit and reporting purposes.

7. User Stories & Acceptance Criteria

Each final user story includes acceptance criteria. A story without acceptance criteria is considered incomplete.

7.1 Admin Staff — Create Request

As an admin staff member, I want to create a request so that customer work is not missed.

Acceptance Criteria

- Given an admin has entered valid customer and request details, when they click Save, then the new request appears in the request list with new status.
- Given required fields (customer name, phone, address) are missing, when the admin clicks Save, then the system blocks submission and highlights the missing fields.

7.2 Admin Staff — Scheduling

As an admin staff member, I want to assign a staff member, date and priority so that work is planned and nothing is forgotten.

Acceptance Criteria

- Given a request exists, when the admin assigns staff, date and priority, then the request status updates to Scheduled.
- Given a request has no assigned staff, when the admin tries to set it to Scheduled, then the system prevents the change.

7.3 Service Staff — View Assigned Jobs

As a service staff member, I want to view my assigned requests so that I know what to complete next.

Acceptance Criteria

- Given a service staff member log in, when they open their dashboard, then they see only requests assigned to them, ordered by scheduled date.
- Given a service staff member completes a job, when they enter completion notes and mark it Completed, then the request status updates and is removed from their active list.

7.4 Manager — Overdue Visibility

As a manager, I want to view overdue requests so that I can take action quickly.

Acceptance Criteria

- Given requests exist with a scheduled date in the past that are not Completed, when the manager opens the dashboard, then those requests appear in an Overdue view.
- Given the manager filters by staff member, when a filter is applied, then only that staff member's requests are shown.

7.5 Customer — Appointment Confirmation

As a customer, I want to receive appointment confirmation so that I know when the team will visit.

Acceptance Criteria

- Given a request is set to Scheduled, when the schedule is confirmed, then the customer's contact record shows the confirmed date/time for staff to communicate.
- Given a scheduled date change, when admin updates it, then the change is logged in the contact-notes history.

8. Prioritization

Priority	Meaning	Example
Must	Required for project success	Create and track service requests

Priority	Meaning	Example
Should	Important but not blocking	Dashboard charts for request volume
Could	Useful if time allows	Automated SMS notification
Will not	Outside this project	Full mobile app and payment gateway

9. Requirements Traceability

Business Need	Requirement(s)	User Story	Output
Request visibility	FR-01, FR-03, FR-06	Admin: create a request; Manager: filter requests	Request list view (Screen 1)
Better scheduling	FR-02 and the Scheduled business rule	Admin: assign staff, date, and priority	Create / Schedule screen (Screen 2)
Clear status flow	FR-04, FR-05	Service staff: view assigned requests and complete them with notes	Status workflow
Customer communication	FR-07	Customer: receive appointment confirmation	Contact-notes history
Manager reporting	FR-03, FR-08, FR-09	Manager: view overdue requests	Manager dashboard (Screen 3)
Controlled delivery	NFR-01 to NFR-05	Project objective (see Project Plan)	Project Plan and UAT Plan
