Wireframes

Screen Concepts for the Core Service Request Workflow

ServiceFlow

Customer Service Improvement & Project Delivery Plan

Prepared for: NovaCare Services

Prepared by: Maleesha Nanayakkara, Business Analyst & Project Manager (Intern)
Codezela Career Accelerator — Business Analysis & Project Management Internship

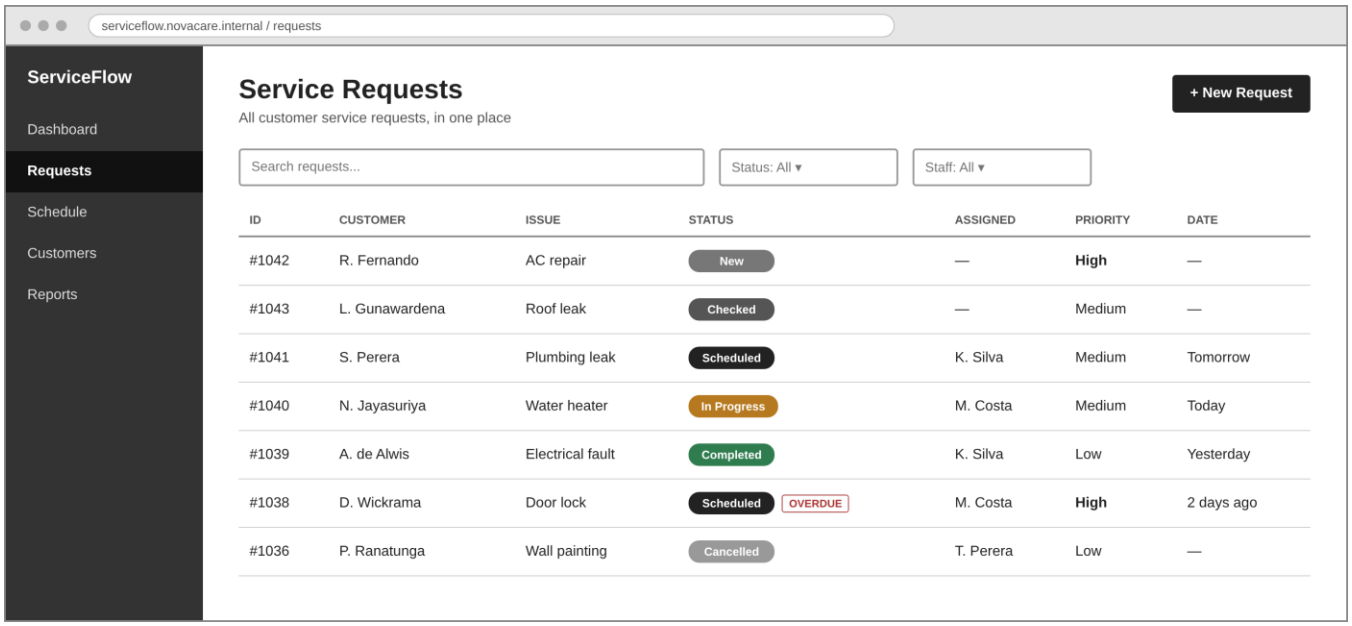

1. Purpose

This document presents low-fidelity wireframe concepts for the three most important ServiceFlow screens, built directly from the requirements, user stories and acceptance criteria in the Requirements Pack. These are concept sketches to guide a design or development team — not final visual design.

Each wireframe is annotated with the requirement IDs and user stories it supports, so the traceability from business need through to screen concept is clear.

2. Screen 1 — Request List (Admin View)

The default view for admin staff: every request in one place, searchable and filterable, with status shown briefly.

Supports

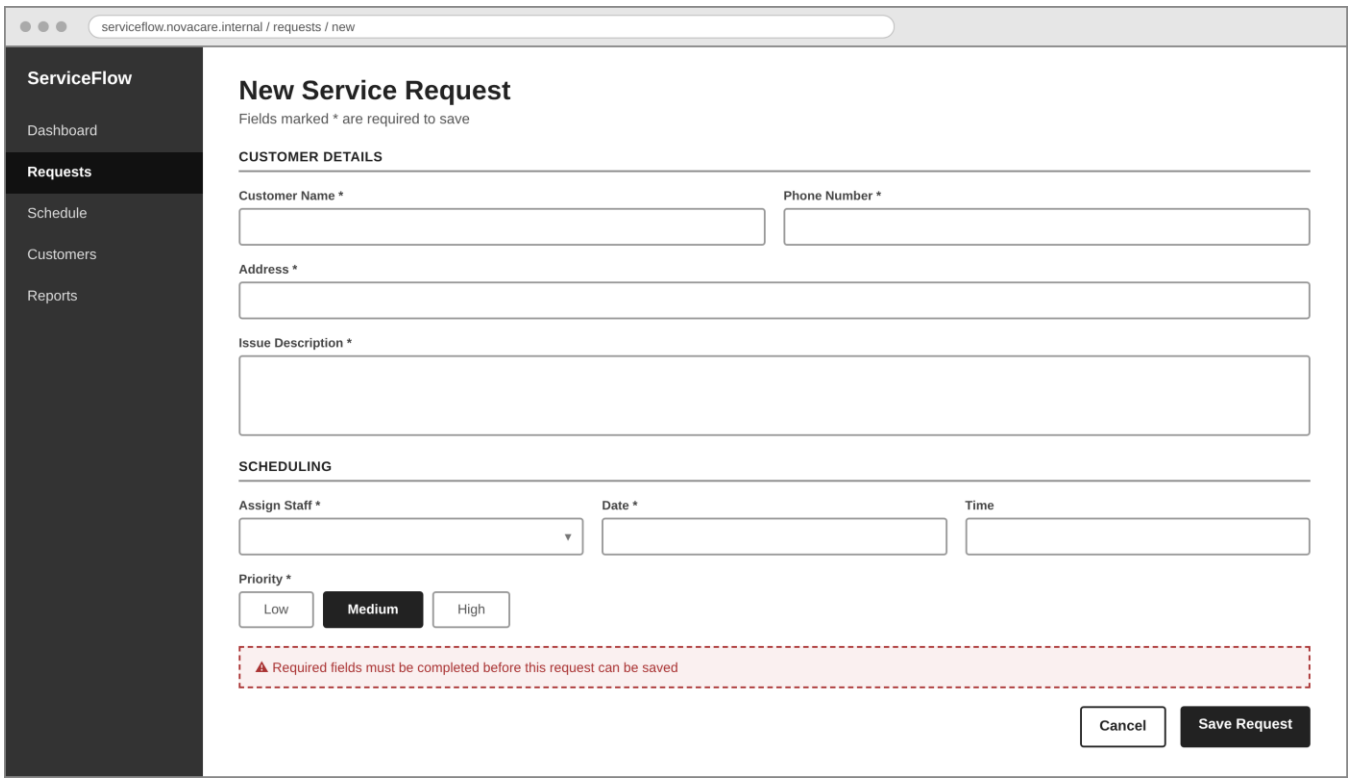

- FR-01 — create a new service request.
- FR-03 — filter requests by status and assigned staff.
- FR-04 — track requests through New, Checked, Scheduled, In Progress, Completed and Cancelled (Overdue is shown as a flag, not a status)

Key Design Notes

- Status shown as a colored pill for fast visual scanning — directly answers the "no single request list" and "poor status tracking" problems in the Business Case.
- Search and filter bar sits above the table so admin staff can narrow results without leaving the screen.
- "+ New Request" is the primary action, placed top-right where admin staff will look first.

3. Screen 2 — Create / Schedule Request

The form admin staff use to log a new request and, in the same flow, assign staff, date and priority — combining intake and scheduling into one step.

Supports

- FR-01 — create a new service request with customer name, phone, address, and issue description.
- FR-02 — assign a request to a staff member, date, time, and priority.

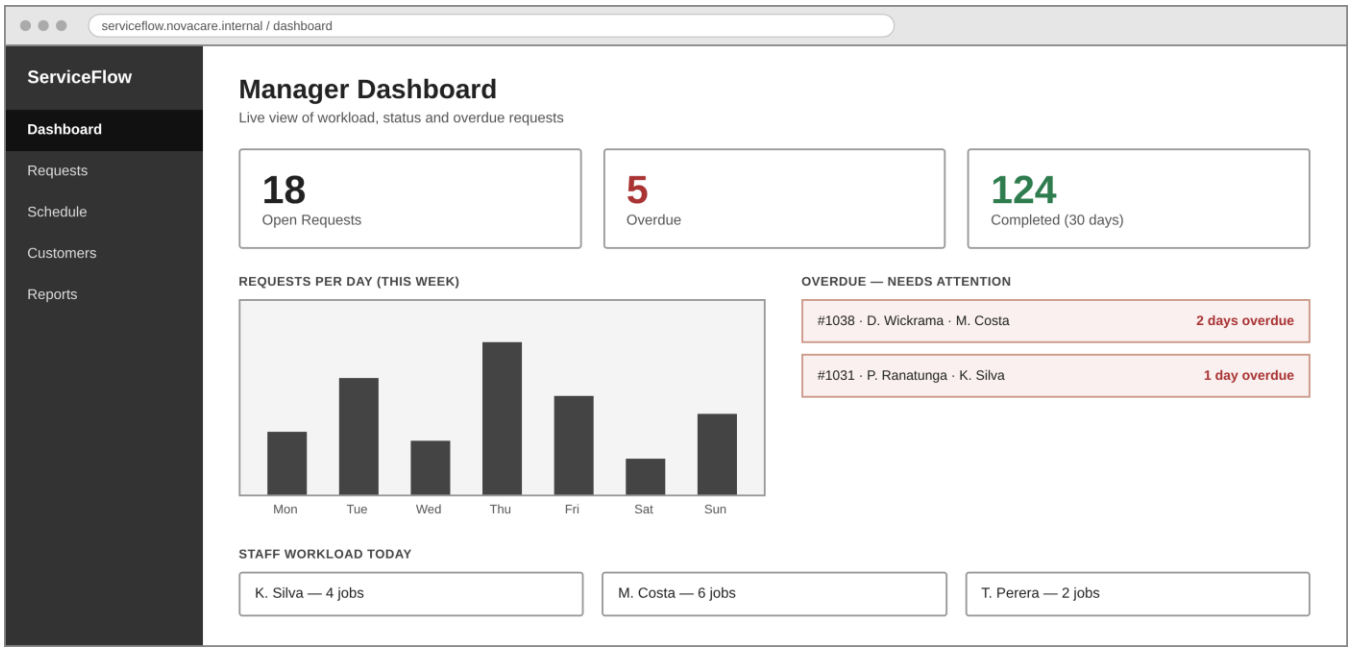

- FR-05 and the business rule — a request cannot be marked Completed without completion notes; here it cannot be saved without required fields.

Key Design Notes

- Required fields are marked with * and validated before saving, matching the acceptance criteria in the Requirements Pack.
- Fields are grouped into "Customer Details" and "Scheduling" to mirror the two halves of the core workflow.
- Priority is a simple 3-option selector (Low / Medium / High) rather than free text, to keep reporting consistent.

4. Screen 3 — Manager Dashboard

The manager's home screen: workload, overdue requests, and daily volume, visible without asking staff for an update.

Supports

- FR-08 — manager dashboard with counts of open, overdue, and completed requests
- Manager user story — view overdue requests to act quickly.

Key Design Notes

- Three KPI cards (Open, Overdue, Completed) give an instant read of workload — directly answers the "weak reporting" and "no manager workload visibility" gaps identified in the Process Pack.
- Overdue requests are visually flagged (red) and listed separately so they cannot be missed.
- Staff workload strip at the bottom supports fair job distribution across the team.

5. How These Fit the Delivery Pack

These wireframes are concept-level evidence only, in line with the project's scope — the brief does not require a working system or final visual design, only a clear enough concept for a design, development or operations team to start work.

- Requirements Pack — defines what each screen must do (functional/non-functional requirements, business rules).
- Process Pack — defines the workflow these screens support (to-be process, core workflow).
- Project Plan — "Design planning" work package (Week 2) covers producing this wireframe evidence.
- Handover Pack — UAT test cases can be run directly against these screens without needing working software.
